Research Interests

Information in Financial Markets, Behavioral Finance, Entrepreneurial Finance.

Education

University of Zürich and Swiss Finance Institute (SFI) *Sep 2022 – Present*

- PhD Candidate, Department of Finance,
- Main advisor: Prof. Markus Leippold
- First-year Doctoral Grant

University of Southern California Marshall School of Business *Sep 2026 – Present*

- Visiting Scholar
- Host: Prof. David Hirshleifer

ETH Zurich and University of Zurich *Sep 2020 – Sep 2022*

- MSc Quantitative Finance (Jointly offered program)

University of Oxford *Sep 2019 – Jul 2020*

- MSc Mathematical and Computational Finance
- Honors: Graduation Award: Distinction

Nanjing University *Sep 2015 – June 2019*

- Bachelor of Sciences in Mathematics
- Honors: The National Elite Program; The People's Scholarship; The Guanghua Scholarship

Job Marke Paper

Timing and the Teller: How Markets Price News

Investors react strongly to some news and barely to other news, even when every story conveys new information. Combining a simple Bayesian model of learning with Dow Jones Newswires data from 2000 to 2023, this paper studies how investors learn from a news story in context: what they have recently learned about the firm, and who is telling them. I focus on consecutive news, a story that shares the sign of the firm's most recent prior story. Controlling for informational content, consecutive stories move prices up to 9% less than initial stories and this discount disappears within two weeks. News origin determines the reason behind it. Consecutive stories from journalists or third parties have weaker price reactions and less trading. When the gap between the two stories is only a few days, no post-news drift emerges, consistent with anticipation. When the gap is roughly a week, post-news momentum emerges, consistent with limited attention. Consecutive stories from the firm itself generate more trading with no price discount or drift, indicating disagreement. The discount appears mainly in good news sequences and much less in bad news sequences. Anticipation is more visible in firms with high institutional ownership while disagreement dominates in firms with low institutional ownership.
